European Market

## W22 Line – High Efficiency Motors

The increasing demand for electrical energy to sustain global development requires consistent heavy investments in power supply generation. However, in addition to complex medium and long term planning, these investments rely on natural resources, which are becoming depleted due to constant pressures upon the environment. The best strategy, therefore, to maintain energy supply in the short term is to avoid wastage and increase energy efficiency. Electric motors play a major role in this strategy; since around 40% of global energy demand is estimated to be related to electric motor applications. Consequently, any initiatives to increase energy efficiency, by using high efficiency electric motors and frequency inverters, are to be welcomed, as they can make a real contribution to reductions in global energy demand.

At the same time as efficiency initiatives make an impact in traditional market sectors, the application of new technologies in emerging sectors is resulting in profound changes in the way that electric motors are applied and controlled. By integrating these changes

together with the demands for increased energy efficiency, WEG has taken up the challenge and produced a new design of high efficiency motor; one that exceeds the performance of WEG's existing W21 motor line, which is recognised worldwide for its quality, reliability and efficiency.

Using the latest generation of computerised tools, such as structural analysis software (finite element analysis) and computer fluid dynamics, as well as electrical design optimisation software, an innovative – next generation – product has been developed: the W22 motor.

Several key objectives have been achieved in the design of the W22 motor:

- Reduction of noise and vibration levels
- Increased energy efficiency and reduced thermal footprint
- Easy maintenance
- Compatibility with present & future generations of frequency inverters
- Flexible and modular design

The WEG W22 is what the industrial world needs today, to help sustain its future – tomorrow. Visit [www.weg22ways.net](http://www.weg22ways.net) to find out more.

### **Sustainability and Carbon Emission reduction through Premium Efficiency Motors**

The Premium Efficiency (IE3) level established in IEC 60034-30: 2008 is considered the highest efficiency class which a squirrel cage induction motor can achieve whilst remaining economically viable.

It is also the optimum solution to increase the efficiency of an existing application through direct replacement.

So, why have Premium Efficiency motors not become the Industry standard?

It may be argued that premium efficiency motors are also premium in price when comparing against standard efficiency (IE1) and high efficiency (IE2) motors.

Whilst this is not strictly untrue, it should be appreciated when considering their lifetime that the cost of acquisition typically represents only 1% of the total cost of ownership of an electric motor. In contrast, the associated energy savings provided by premium efficiency motors far outweigh this additional investment in purchase price.

The reduction in CO<sub>2</sub> emissions is one of the direct consequences, and therefore benefits, of increasing efficiency in industry.

For example, according to the guidelines set out by the International Energy Agency (IEA) of 504kg of CO<sub>2</sub> per 1,000kWh, it is possible to reduce CO<sub>2</sub> emissions by approximately 1,000kg per year with one 3kw premium efficiency motor and by 25,000kg per year with a 250kw premium efficiency motor, when compared against equivalent standard efficiency (IE1) machines.

Go to our website at [www.weg.net](http://www.weg.net) to check the potential reduction in CO<sub>2</sub> emissions and the return on investment of W22 Premium Efficiency motors.

The W22 line from WEG is the first complete range of IE3 motors available to Industry...

...we call it **WEGnology**

## Minimum Energy Performance Standards – Europe

Increasingly, the World seeks a path of sustainability and new ways to reduce energy consumption.

A significant percentage of the electrical energy utilized in facilities around the World is consumed by electric motors.

Consequently, Governments around the World are implementing Energy Efficiency Programs in order to enforce the use of high efficiency motors.

Up until 2009, Europe did not have any specific regulations relating to the energy efficiency levels of electric motors.

There existed only a voluntary agreement between Manufacturers from 1998 that determined the well known efficiency bands EFF1, EFF2 and EFF3.

However, in July of 2009 the European Community introduced the regulation 640/2009 (implementing Directive 2005/32/EC) relating to the scope of supply, implementation dates and efficiency levels of electric motors sold in the European market. This directive bases the efficiency levels on the values stipulated in IEC 60034-30.

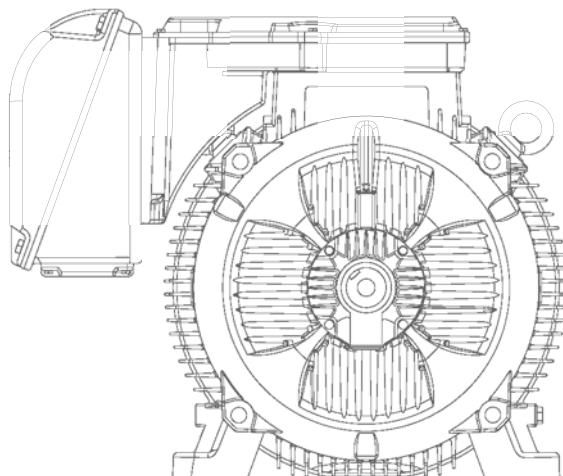

### Scope

The Scope of the European Ecodesign Directive covers single speed, three-phase 50 Hz or 50/60 Hz, squirrel cage induction motors that:

- have 2 to 6 poles
- have a rated voltage  $U_N$  up to 1,000 V
- have a rated output  $P_N$  between 0.75 kW and 375 kW
- are rated on the basis of continuous duty operation

### Effective dates

- from 16 June 2011, motors shall not be less efficient than the IE2 efficiency level (defined in Table 1);
- from 1 January 2015 motors with a rated output of 7.5-375 kW shall not be less efficient than the IE3 efficiency level (defined in Table 1) or meet the IE2 efficiency level and be equipped with a variable speed drive;
- from 1 January 2017 all motors with a rated output of 0.75-375 kW shall not be less efficient than the IE3 efficiency level or meet the IE2 efficiency level and be equipped with a variable speed drive.

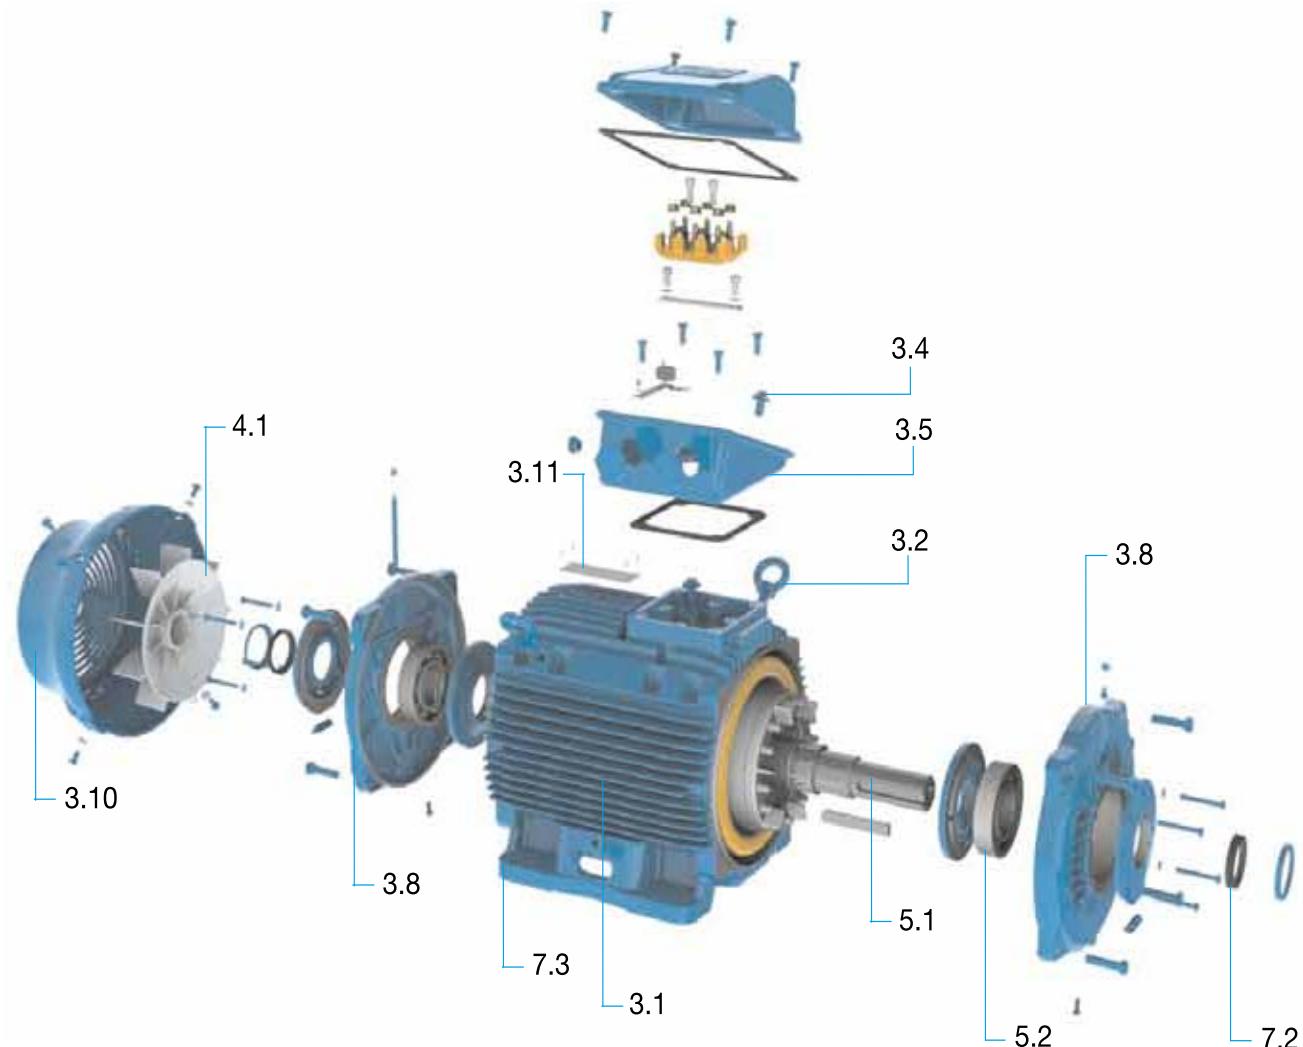

Output	IE1 - Standard Efficiency			IE2 - High Efficiency			IE3 - Premium Efficiency		
	Poles			Poles			Poles		
kW	2	4	6	2	4	6	2	4	6
0.75	72.1	72.1	70.0	77.4	79.6	75.9	80.7	82.5	78.9

## 1. Versions available

For the European market, W22 motors are available in three versions in accordance with IEC 60034-30: 2008: Standard Efficiency (IE1), High Efficiency (IE2) and Premium Efficiency (IE3). In figure 1 the efficiency levels of W22 motors at 50 Hz can be compared with the minimum levels established by IEC 60034-30.

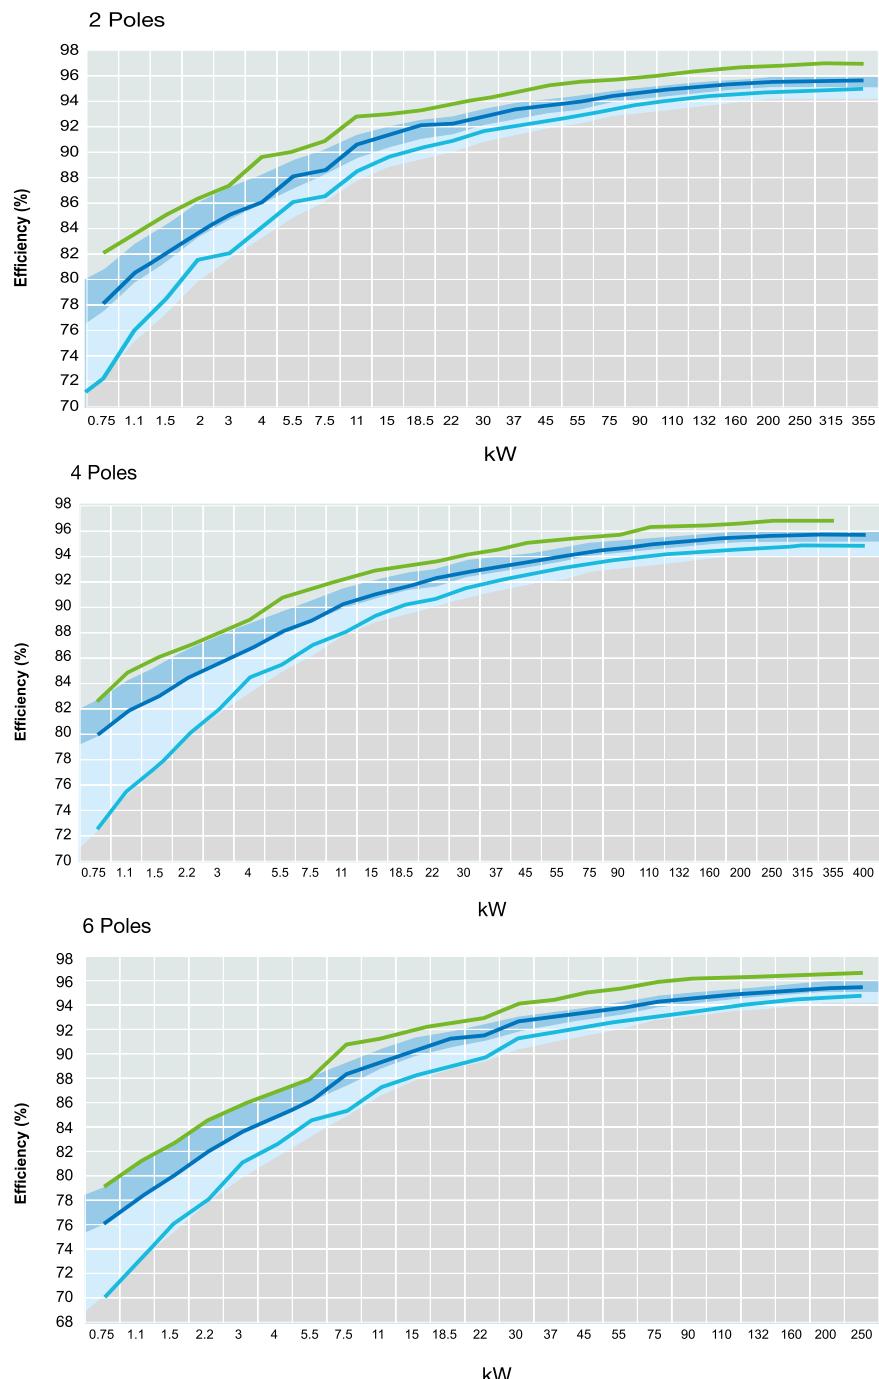

Figure 1 – Efficiency levels

<span style="color: cyan;">█</span> W22 Standard Efficiency (IE1)
<span style="color: mediumblue;">█</span> W22 High Efficiency (IE2)
<span style="color: darkblue;">█</span> W22 Premium Efficiency (IE3)
IE1
IE2
IE3

For all three efficiency levels the W22 motors exceed the minimum figures required by the Standard. They are fully tested and have their efficiency figures declared in accordance with IEC 60034-2-1: 2007 Standard with stray load losses directly determined by summation of losses.

Premium Efficiency motors have the output versus frame ratio as per EN50347 Standard, allowing replacement of existing EFF2 and EFF1 motors with Premium Efficiency units.

Another characteristic of the electrical design of the W22 line is that it was conceived so that its efficiency remains practically constant in the 75% to 100% load range. Therefore, even when the motor does not run at full load its efficiency is not considerably affected (see figure 2), resulting in high levels of energy efficiency.

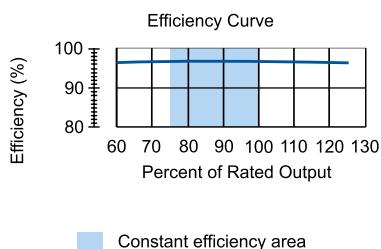

Figure 2 – Typical efficiency curve of W22 line

## 2. Standards

W22 motors meet the requirements and regulations of the latest version of the following Standards:

- IEC60034-1 Rotating electrical machines – Part 1: Rating and performance.
- IEC60034-2-1 Rotating electrical machines – Part 2-1: Standard methods for determining losses and efficiency from tests (excluding machines for traction vehicles).
- IEC60034-5 Rotating electrical machines – Part 5: Degrees of protection provided by the integral design of rotating electrical machines (IP code) - classification.
- IEC60034-6 Rotating electrical machines – Part 6: Methods of cooling (IC code).
- IEC60034-7 Rotating electrical machines – Part 7: Classification of types of enclosures and mounting arrangements (IM code).
- IEC60034-8 Rotating electrical machines – Part 8: Terminal markings and direction of rotation.
- IEC60034-9 Rotating electrical machines – Part 9: Noise limits.
- IEC60034-11-1 Rotating electrical machines – Part 11-1: Thermal protection.
- IEC60034-12 Rotating electrical machines – Part 12: Starting performance of single-speed three-phase cage induction motors.

IEC60034-14 Rotating electrical machines – Part 14: Mechanical vibration of certain machines – Limits of vibration.

IEC60034-30 Rotating electrical machines – Part 30: Efficiency classes for single-speed three-phase cage induction motors.

IEC60072-1 Dimensions and output series for rotating electrical machines – Part 1: Frame numbers 56 to 400 and flange numbers 55 to 1080.

## 3. Construction details

The information included in this document refers to standard construction features and the most common variations for W22 motors in low voltage for general applications in frame sizes from IEC 63 to 355A/B.

W22 motors for special and/or customised applications are available on request. For more information, please contact your WEG office or distributor.

### 3.1 Frame

The W22 frame (figure 3) is manufactured in FC-200 cast iron to provide high levels of mechanical strength to cater for the most critical applications. The cooling fins are designed to minimize the accumulation of liquids and dust over the motor.

Figure 3 – W22 Frame

The motor feet are completely solid for better mechanical strength (figure 4), allowing easier alignment and installation.

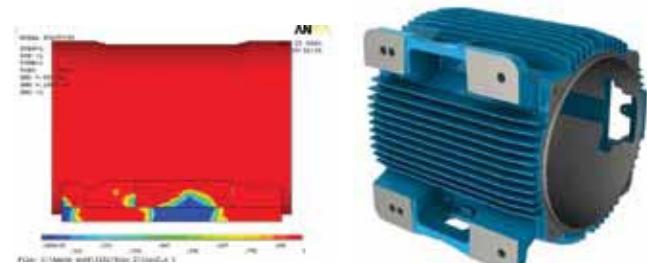

Figure 4 – Solid feet

### 3.2 Eyebolts

Eyebolts are available from frame size 100L. The position of the eyebolts are shown in the table 3:

Number of eyebolts	Description
1	Frames 100L to 200L Motors with feet and with side mounted terminal box
2	Frames 100L to 200L Motors with feet and with top mounted terminal box
2	Frames 100L to 200L – Motors without feet and with C or FF flange
2	Frames 225S/M to 355A/B – Motors with feet and side or top mounted terminal box. These motors have four threaded holes in the upper part of the frame for fastening of the eyebolts (figure 5)
2	Frames 225S/M to 355A/B – Motors without feet and with C or FF flange. These motors have four threaded holes in the upper part of the frame for fastening of the eyebolts and two more threaded holes in the bottom part

Table 3: Eyebolts

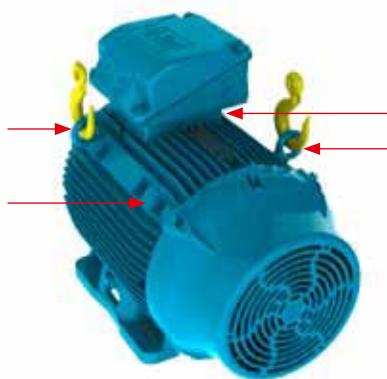

Figure 5: Motor with four threaded holes for fastening of the eyebolts

### 3.3 Points for vibration monitoring

To allow easy maintenance, specifically vibration testing, the 160 to 355 frames are designed with flat areas on both ends for better placement of the accelerometer (figure 6).

These areas are available both in vertical and horizontal planes. Besides areas on the frame, W22 motors count on flat areas on the endshields for easier installation of accelerometers.

As an option M8 threads for SPM accelerometers can be supplied.

Figure 6 - Flat surfaces for vibration monitoring on the back and front side

### 3.4 Earth terminals

All frames from 63 to 355A/B are provided with two earth terminals located inside and adjacent to the terminal box (see figure 7).

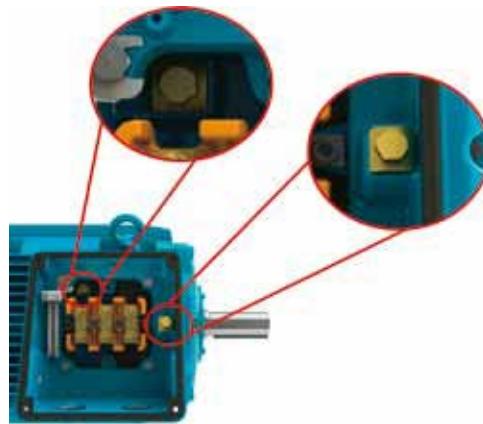

Figure 7 - Earth terminals in the terminal box

For frames 225S/M to 355A/B, two additional earth terminals on each side of the frame are provided to equalize electrical potential and provide greater safety for operators (figure 8).

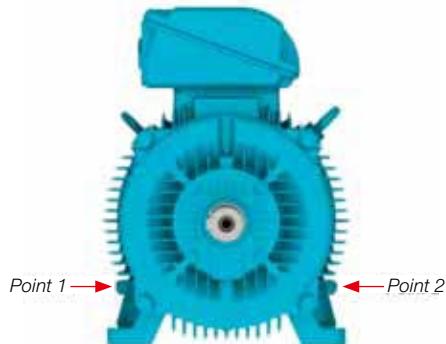

Figure 8 - Earth terminals position in the frame

### 3.5 Terminal box

The terminal box of W22 motors is made with FC-200 cast iron, which is the same material used to produce the frame and endshields. It is diagonally split for easier handling of leads and connections.

It is possible to supply 355A/B motors with an oversized terminal box. In this case, the aspect of the motor with side and top mounted terminal box is shown in the figures 9.1 and 9.2.

Figure 9.1 and 9.2 - Frame size 355A/B with oversized terminal box

For frame sizes 225S/M to 355A/B the terminal box is positioned towards the drive end of the motor and on top as standard.

This arrangement allows improvement of the airflow over the cooling fins, thus reducing motor operating temperatures.

Terminal box position on either the left or right hand side of the motor is possible through the use of an adaptor (see figure 10).

Figure 10 - Terminal box mounted on the left side viewing from shaft end

When supplied from the factory with a side mounted terminal box arrangement, this can be positioned on the opposite side simply by rotating the adaptor.

Similarly, by removing the adaptor and adjusting the length of the motor leads, the terminal box can be positioned on top of the motor.

The flexibility of terminal box positions on the W22 motor offered by the adaptor can be seen in figure 11.

Figure 11 – Terminal box mounted on both sides and on top (versatility)

Conversely, factory supplied motors with the terminal box position on top can be modified to side mounting by fitting the adaptor and extending the motor leads.

For the frame size range 63 to 200 the terminal box position is centralized on the motor frame and can be supplied in two configurations – top (standard) or left / right side (optional). A motor with a side mounted terminal box (B3R or B3L) can have the terminal box position located on the opposite side through modification.

Please Note: For all terminal box position modifications please contact WEG or your local WEG service centre.

For all frames, the terminal box can be rotated in 90° increments. Motors in IEC frame sizes 315L, 355M/L and 355A/B are supplied with removable cast iron cable gland plates. As an option, the gland plates can be supplied undrilled.

Motors are supplied with plastic threaded plugs in the cable entries to maintain the degree of protection during transport and storage.

In order to guarantee the degree of protection, cable entries must comply with at least the same degree of protection indicated on the motor nameplate. Lack of compliance with such detail can invalidate the motor warranty. If required, please contact the WEG Service Area for further advice.

### 3.6 Power supply connection leads

Motor power supply leads are marked in accordance with IEC 60034-8 and are connected to a terminal block made from a polyester based resin BMC (Bulk Moulding Compound), duly reinforced with fibre glass (see figure 12).

Figure 12: Six-pin terminal block

Motors 355A/B are provided with the terminal block as shown in the figure 13.

Figure 13: 355A/B terminal block

### 3.7 Accessory connection leads

Accessory terminals are assembled on connectors whenever the motor is supplied with a terminal block. They may be assembled inside the main power terminal box or in a separate accessory terminal box (figure 14).

Whether the accessory terminals are assembled inside the main power or a separate terminal box, an M20 x 1.5 threaded hole is provided for fitting of cable glands for the incoming connection leads.

In the Mechanical Data section of this catalogue it is possible to check the quantity of connectors that may be assembled inside the main power and accessory terminal boxes.

Figure 14: Accessory terminal box attached to power terminal box

For frames 132 to 355, there is also the option of providing a dedicated terminal box for the connection of space heaters as shown in figure 15.

Figure 15: Two accessory terminal boxes attached to power terminal box

### 3.8 Endshields

The drive end endshield (figure 16) is designed with fins for better thermal heat dissipation, and to ensure low bearing operating temperatures, resulting in extended lubrication intervals.

For the frames 225S/M to 355A/B, where ventilation is critical for thermal performance of the motor, the endshield fastening screws are placed in such a way so as not to block airflow to any fin, thus contributing to better thermal exchange.

Figure 16 – Drive and non-drive endshields

### 3.9 Drains

The endshields have holes for drainage of water that may condense inside of the frame. These holes are supplied with rubber drain plugs, in accordance with figure 17 for frame range 160 to 355. These plugs leave the factory in the closed position and must be opened periodically to allow the exit of condensed water. In the 63 to 132 frame range, plugs are automatic and made of plastic.

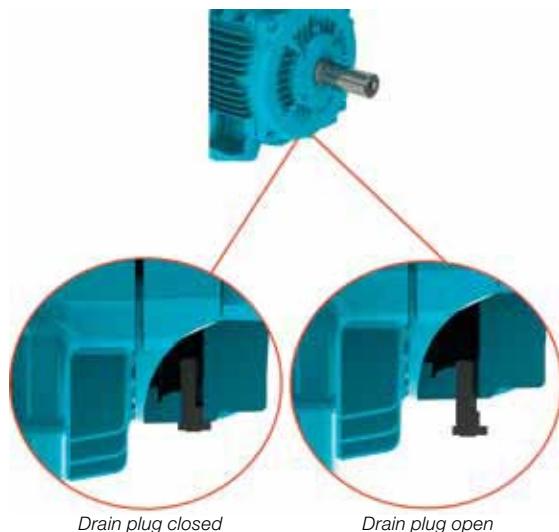

Figure 17: Detail of the drain plug position on drive endshield (160-355)

### 3.10 Fan cover

The fan cover is made of steel for frames 63 to 132 and FC-200 cast iron for frames 160 to 355. The cast iron fan covers have an aerodynamic design, which results in a significant reduction in noise level and optimized airflow between frame fins for heat exchange improvement. Figure 18 shows the aerodynamic design of the cast iron fan cover.

Figure 18 – Fan cover

### 3.11 Nameplate

The nameplate supplies information determining motor construction and performance characteristics. The line name is given on the first line of the nameplate together with nominal efficiency levels as required by IEC 60034-30.

Figure 19 – Nameplate position of W22 motors

\* Applicable to IE3 Premium Efficiency Motors

Table 5 – Sound pressure levels for 60 Hz motors

Figure 22 – Cooling system

The cooling system (fan, non drive endshield and fan cover) is designed to minimize the noise level and improve thermal efficiency (figure 23).

The noise level figures shown in tables 4 and 5 are taken at no load. Under load the IEC 60034-9 Standard foresees an increase of the sound pressure levels as shown in table 6.

Frame (mm)	2 poles	4 poles	6 poles	8 poles
90 ≤ H ≤ 160	2	5	7	8
180 ≤ H ≤ 200	2	4	6	7
225 ≤ H ≤ 280	2	3	6	7
H = 315	2	3	5	6
355 ≤ H	2	2	4	5

Table 6 – Maximum expected increase of sound pressure level for loaded motors.

Note: These figures refer to operating frequencies of 50 Hz and 60 Hz.

The global noise level can be reduced up to 2 dB (A) with the installation of a drip cover.

#### 4.2 Vibration level

Vibration of an electrical machine is closely related to its assembly on the application and, thus, it is generally desirable to perform vibration measurements under installation and operational conditions. Nevertheless, to allow evaluation of the vibration generated by the electrical machine itself in a way to allow reproducibility of the tests and the obtaining of comparative measurements, it is necessary to perform such measurements with the machine uncoupled, under controlled test conditions. The test conditions and vibration limits described here are those found in IEC 60034-14.

The severity of vibration is the maximum value of vibration found among all the recommended measurement points and directions. The table below indicates the recommended admissible values of vibration severity under IEC standard 60034-14 for the frames IEC 56 to 400, for degrees of vibration A and B.

W22 motors are dynamically balanced with half key and the standard version meets the vibration levels of Grade A (without special vibration requirements) described in IEC 60034-14 Standard. As an option, motors can be supplied in conformance with vibration of Grade B. The RMS speed and vibration levels in mm/s of Grades A and B are shown in table 7.

Vibration	Frame	56 ≤ H ≤ 132	132 < H ≤ 280	H > 280
	Assembly	Vibration speed RMS (mm/s)	Vibration speed RMS (mm/s)	Vibration speed RMS (mm/s)
Grade A	Free suspension	1.6	2.2	2.8
Grade B	Free suspension	0.7	1.1	1.8

Table 7 – Speed and vibration levels

#### 4.3 Impact resistance

The W22 motor complies with impact level IK08 – mechanical impact of 5J as per EN 50102 – Degrees of protection provided by enclosures for electrical equipment against external mechanical impacts (IK code) ensuring superior mechanical strength for the most demanding applications.

## 5. Shaft / Bearings

### 5.1 Shaft

The shaft of W22 standard motors is made of AISI 1040/45 steel, in frames IEC 63 to 315S/M, and in AISI 4140 steel for frames 315L, 355M/L and 355A/B. When supplied with roller bearings (optional for frames 160 and above), the shaft material must be AISI 4140.

As they are fitted with AISI 4140 steel shafts in frames 315L, 355M/L and 355A/B, W22 motors can employ roller bearings, making them suitable for heavy duty applications such as pulley and belt applications. Information about maximum allowable radial and axial loads on shaft ends is given in tables 9, 10 and 11.

Important: Under such circumstances, the non drive end bearing cap needs to be replaced as the non drive end bearing must be locked.

Shafts are supplied with an open profile key way, with a threaded centre hole and have dimensions shown in section 17 – Mechanical data.

W22 motors can be supplied with a second shaft end as per dimensions shown in section 17 – Mechanical data.

Information about maximum allowable radial and axial loads on the second shaft end is available on request.

As an option, W22 motors can be supplied with stainless steel shafts (AISI 316 and AISI 420) for highly corrosive environments.

*Note: 2 pole motors will have as an option only the shaft end in stainless steel AISI 316.*

### 5.2 Bearings

W22 motors are supplied with deep groove ball bearings as standard (figure 24). Optionally, frame size 160 and above can be supplied with NU series roller bearings, where high radial loads may occur.

Figure 24: Bearing view

The nominal bearing life L10h is 20,000 or 40,000 hours in conformance with maximum radial and axial loads as described in tables 9, 10 and 11. When direct coupled to the load (without axial or radial thrusts), the L10h bearing life is 50,000 hours.

In standard configuration, with ball bearings, the drive end bearing is locked axially from frame 160. To compensate for any axial movement the motors are fitted with pre-load washers for frames 63 to 200 and with pre-load springs for frames 225 to 355. When provided with roller bearings, the

rear bearing is locked and the axial movement is compensated by the axial play of the front roller bearing. Minimum and maximum admissible radial loads for roller bearings are shown in table 10 on page 16.

Bearings lifetime depends on the type and size of the bearing, the radial and axial mechanical loads it is submitted to, operating conditions (environment, temperature), rotational speed and grease life. Therefore, bearing lifetime is closely related to its correct use, maintenance and lubrication.

Respecting the quantity of grease and lubrication intervals allows bearings to reach the lifetime given. W22 motors in IEC frames 225S/M and above are provided as standard with grease fittings in each endshield to permit the relubrication of the bearings. The quantity of grease and lubrication intervals are stamped in the motor nameplate. The lubrication interval is shown in tables 12 and 13 - page 17.

It must be emphasized that excessive lubrication, i.e. a quantity of grease greater than that recommended on the motor nameplate, can result in the increase of bearing temperatures leading to reduced operating hours.

#### Note:

1. L10 lifetime means that at least 90% of the bearings submitted to the maximum indicated loads will reach the number of hours indicated. The maximum admissible radial and axial loads for the standard configuration are shown in table 9, 10 and 11. The values of the maximum radial load consider axial load as nil. The values of the maximum axial load consider radial load as nil. For bearing lifetime in combined axial and radial loads condition contact WEG.  
2. The radial force value  $F_r$  usually results from information recommended on catalogues of pulley/belts manufacturers. When this information is not available, the force  $F_r$ , under operation, can be calculated based on the output power, on coupling design characteristics with pulleys and belts and on the type of application. So we have:

$$F_r = \frac{19,1 \cdot 10^6 \cdot P_n}{n_n \cdot dp} \cdot ka \text{ (N)}$$

Where:

$F_r$  is the radial force caused by pulley and belt coupling [N];

$P_n$  is the motor rated power [kW];

$n_n$  is the motor rated speed per minute [rpm];

$dp$  is the pitch diameter of the driven pulley [mm];

$ka$  is a factor that depends on belt tension and type of application (table 8).

Groups and Basic Types of Application		ka Factor of the application	
		Vee Belts	Plane Belts
1	(Fans and Blowers. Centrifugal Pumps. Winding machines. Compressors. Machine tools) with outputs up to 30 HP (22 kW)	2.0	3.1
2	(Fans and Blowers, Centrifugal Pumps, Winding machines, Compressors, Machine tools) with outputs higher than 30 HP (22 kW), Mixers, Plungers, Printer Machines.	2.4	3.3
3	Presses, vibrating screens, Piston and screw compressor, pulverisers, helicoidal conveyors, woodworking machines, Textile machines, Kneading machines, Ceramic machines, Pulp and paper industrial grinders.	2.7	3.4
4	Overhead cranes, Hammer mills, Metal laminators, Conveyors, Gyratory Crushers, Jaw Crusher, Cone Crushers, Cage Mills, Ball Mills, Rubber Mixers, Mining machines, Shredders.	3.0	3.7

Table 8 –  $ka$  factor

#### Important:

##### 1 - Special applications

Motor operation under adverse operating conditions, such as higher ambient temperatures and altitudes or abnormal axial / radial loads, may require specific lubrication measures and alternative relubrication intervals to those indicated in the tables provided within this technical catalogue.

##### 2 - Roller bearings

Roller bearings require a minimum radial load so as to ensure correct operation. They are not recommended for direct coupling arrangements, or for use on 2 pole motors.

##### 3 - Frequency inverter driven motors

Bearing life may be reduced when a motor is driven by a frequency drive at speeds above nominal. Speed itself is one of the factors taken into consideration when determining motor bearing life.

##### 4 - Motors with modified mounting configurations

For motors supplied with horizontal mounting but working vertically, lubrication intervals must be reduced by half.

##### 5 - Figures for radial thrusts

The figures given in the tables below for radial thrusts take into consideration the point upon which the load is applied, either at the centre of the shaft ( $L/2$ ) or at the end of the shaft ( $L$ ), figure 25.

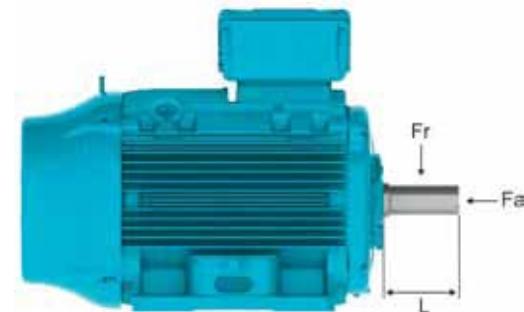

Figure 25 – Radial and axial thrust on motor shaft

Note: the amount of grease is indicated on the nameplate

### 5.2.2 Bearing monitoring

On request, W22 motors can be equipped with bearing temperature detectors which monitor bearing operating conditions. The most commonly used accessory is the PT-100 temperature detector for continuous monitoring of bearing operating temperature.

This type of monitoring is extremely important considering that it directly affects the grease and bearing lives particularly on motors equipped with regreasing facilities.

## 6. Mounting forms

Motors are supplied, as standard, in the B3T configuration, with the terminal box on top.

Figure 26 – B3T mounting

The mounting configuration for the W22 motor lines comply with IEC standard 60034-7. Standard mounting forms and their variations are shown in table 14. After the designation, a characteristic letter is used to define the terminal box position. So, the mounting code IM B3 can be seen in WEG documents as detailed below (without IM code).

B3L – terminal box on left hand side of the motor frame

B3T – terminal box on top of the motor frame

B3R – terminal box on right hand side of the motor frame

Note: The terminal box position is defined viewing the motor from the shaft end (figure 26).

Basic mountings	Other type of mounting				
	IM V5	IM V6	IM B6	IM B7	IM B8
IM B3					
IM 1001	IM 1011	IM 1031	IM 1051	IM 1061	IM 1071
IM B35	IM V15	IM V36	- *)	- *)	- *)
IM 2001	IM 2011	IM 2031	IM 2051	IM 2061	IM 2071

IM 3001	IM 3011	IM 3031			
IM B14	IM V18	IM V19			
IM 3601	IM 3611	IM 3631			

Table 14 – Mountings configurations

\* Non-defined mountings by IEC 60034-7

### Important:

1. The mountings IM B34 and IM B14 with C-DIN flange, in accordance with DIN standard EN50347, are limited to frame size 132; C flange in accordance with NEMA MG1 Part 4 standard is available for frames 63 to 355M/L.
2. For motors mounted vertically shaft down fitting of a drip cover is recommended to prevent ingress of small objects into the fan cover. The increase in total length of the motor with drip cover is shown in the section 19.
3. For vertically shaft up mounted motors installed in environments containing liquids, the use of a rubber slinger is recommended to prevent the ingress of liquid into the motor through the shaft.

## 7. Degree of protection / Sealing system / Painting

### 7.1 Degree of protection

As per IEC 60034-5 Standard, the degree of protection of a rotating electrical machine consists of the letters IP (ingress protection), followed by two characteristic numerals, with the following meaning:

- a) First characteristic numeral: referred to protection of people against or approach to live parts and against contacts with moving parts (other than smooth rotating shafts and the like) inside the enclosure and protection of the machine against ingress of solid and foreign objects.
- b) Second characteristic numeral: protection of machines against harmful effects due to ingress of water.

W22 motors are supplied with degrees of protection in conformance with IEC 60034-5. As standard, they are IP55, which means:

- a) First characteristic numeral 5: machine protected against dust. The enclosure is protected against contact with moving parts. Ingress of dust is not totally prevented, but dust does not enter in sufficient quantity to interfere with satisfactory operation of the machine.
- b) Second characteristic numeral 5: Machine protected against water jets. Water projected by a nozzle against the machine from any direction shall have no harmful effect.

## 7.2 Sealing system

The sealing system applied to the shaft of W22 motors in frame 63 to 200 is V'ring. For frames 225S/M to 355A/B the sealing system is the exclusive WSeal®, which consists of a double lipped V'Ring with a metallic cap (see figure 27). This configuration operates like a labyrinth preventing ingress of water and dust into the motor.

Figure 27 – WSeal®

Alternatively, W22 motors can be supplied with other sealing systems, for example, Oilseal, tachonite labyrinth and the WEG exclusive W3Seal®, among others (see Section 15 – Optional features).

When fitted with flange, the recommended seal is lip seal (no contact with liquid) and Oilseal (with contact with liquid)

## 7.3 Painting

Figure 28 – WEG internal painting plan

W22 motors of frame 63 to 132 are supplied as standard with WEG internal painting plan 207A. This plan consists of:

- Primer: one coat with 20 to 55 µm of alkyd primer;
- Finishing: one coat with 30 to 40 µm of styrenated alkyd synthetic enamel.

For frames 160 to 200, motors are supplied with WEG internal painting plan 201A consisting of:

- Primer: one coat with 20 to 55 µm of alkyd primer;
- Finishing: one coat with 40 to 60 µm of alkyd synthetic enamel.

And, W22 motors of frame 225 up to 355 are supplied as

standard with WEG internal painting plan 203A, consisting of:

- Primer: one coat with 20 to 55 µm of alkyd primer;
- Finishing: one coat with 50 to 75 µm of alkyd synthetic enamel.

These painting plans have a minimum resistance to the salt spray test of 120 hours (plans 207A and 201A) and 240 hours (plan 203A) in accordance with ASTM B 117/03 and may be used in motors applied in normal environments, slightly severe, sheltered or non-sheltered, for industrial use, with low relative humidity, normal temperature variations and the presence of SO<sub>2</sub>.

### Note:

These painting plans are not recommended for direct exposure to acid steam, alkalis, solvents and salty environments.

Alternative painting plans are available on request, which are suitable to guarantee additional protection in aggressive environments, either protected or unprotected (see section 15 – Optional features).

## Tropicalized painting

The integrity of the insulation system is the primary consideration when determining the lifetime of an electric motor. High humidity can result in premature deterioration of the insulation system, therefore for any ambient temperature with relative humidity above 95%, it is recommended to coat all internal components of the motor with an epoxy painting, also known as tropicalization.

## 8. Voltage / Frequency

IEC 60034-1 the combination of voltage and frequency variations are classified as Zone A or Zone B, as per figure 29.

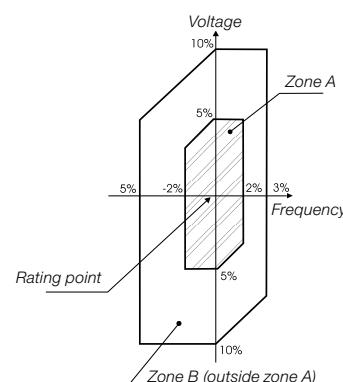

Figure 29 - Rated voltage and frequency limits for electric motors

IEC 60034-1 states that the motor must be suitable to perform its main function (supply torque) continuously at Zone A. However, this motor may not fully meet its performance characteristics due to power supply voltage and frequency variation, which can result in temperature rise above the rated value.

The motor must also be suitable to perform its main function (supply torque) at Zone B. However, the performance characteristic changes will be greater than those operating at Zone A. The temperature rise will also be higher than that of rated voltage and frequency and that operating at Zone A. Prolonged operation near Zone B boundary is not recommended.

## 9. Overload capacity

As per IEC 60034-1, motors with output power up to 315 kW are suitable for an overload 1.5 times the rated torque for 2 minutes.

## 10. Ambient / Insulation

Unless otherwise specified, the rated power outputs shown in the electrical data tables within this catalogue refer to continuous duty operation S1, as per IEC 60034-1 and under the following conditions:

- With ambient temperature range -30°C to +40°C
  - With altitudes up to 1000 metres above sea level
- For operating temperatures and altitudes differing from those above, the factors indicated in table 15 must be applied to the nominal motor power rating in order to determine the derated available output (Pmax).

**Pmax = Pnom x correction factor**

T (°C)	Altitude (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000
10							0.97	0.92	0.88
15						0.98	0.94	0.90	0.86
20					1.00	0.95	0.91	0.87	0.83
25					1.00	0.95	0.93	0.89	0.85
30					1.00	0.96	0.92	0.90	0.86
35					1.00	0.96	0.92	0.89	0.85
40	1.00	0.97	0.94	0.90	0.86	0.82	0.80	0.76	0.71
45	0.95	0.92	0.90	0.88	0.85	0.81	0.78	0.74	0.69
50	0.92	0.90	0.87	0.85	0.82	0.80	0.77	0.72	0.67
55	0.88	0.85	0.83	0.81	0.78	0.76	0.73	0.70	0.65
60	0.83	0.82	0.80	0.77	0.75	0.73	0.70	0.67	0.62
65	0.79	0.76	0.74	0.72	0.70	0.68	0.66	0.62	0.58
70	0.74	0.71	0.69	0.67	0.66	0.64	0.62	0.58	0.53
75	0.70	0.68	0.66	0.64	0.62	0.60	0.58	0.53	0.49
80	0.65	0.64	0.62	0.60	0.58	0.56	0.55	0.48	0.44

Table 15 – Correction factors for altitude and ambient temperature

W22 motors are supplied with class F insulation and Class B (80 K) temperature rise at normal operating conditions (unless otherwise specified).

The difference between the temperature of the class F insulation (105 K) and the temperature rise of the design (80 K) means that, in practice, W22 motors are suitable to supply output ratings above the rated values up to a limit where the temperature rise reaches the temperature rise value of the insulation class.

The ratio between temperature rise and service factor is given by the equation below:

$$\Delta T_{FINAL} \approx (F.S.)^2 \times \Delta T_{INITIAL}$$

Upon service factor calculation, we can see that SF is approximately 1.15. This reserve of temperature also allows W22 motors with class B temperature rise (80 K) to operate continuously at:

- Up to 15% above its rated output power, considering 40°C ambient temperature and 1.000 m.a.s.l.
- Up to 55°C ambient temperature, keeping the rated output power
- Up to 3000 m.a.s.l., keeping the rated output power

**Note:** Please note that under these conditions combined ambient and temperature rise may reach class F limits.

Bearing lubrication intervals will change under operating conditions other than 40°C maximum ambient temperature and 1000 metres above sea level. Contact WEG for more information.

All W22 motors are wound with the WISE® insulation system which consists of enamelled copper wire meeting temperatures up to 200°C and impregnated with solvent free resin. The WISE® system also permits motor operation with variable speed drives (see section 12).

### 10.1 Space heaters

The use of space heaters are recommended in two situations:

- Motors installed in environments with relative air humidity up to 95%, in which the motor may remain idle for periods greater than 24 hours;
- Motors installed in environments with relative air humidity greater than 95%, regardless of the operating schedule. It should be highlighted that in this situation it is strongly recommended that an epoxy paint known as tropicalized painting is applied in the internal components of the motor. More information can be obtained in section 7.3.

The supply voltage for space heaters must be defined by the Customer. For all frame sizes, W22 motors can be provided with space heaters suitable for 110-127 V, 220-240 V and 380-480 V. As an option, dual voltage heaters of 110-127 / 220-240 V can be supplied for motor frame sizes 112 to 355A/B.

The power rating and number of space heaters fitted depends on the size of the motor as indicated in table 16 below:

Frame	Quantities	Power rated (W)
63 to 80	1	7.5
90 and 100	1	11
112	2	11
132 and 160	2	15
180 and 200	2	19
225 and 250	2	28
280 and 315	2	70
355	2	87

Table 16 – Power and quantity of space heaters

## 11. Motor protection

Protections available for W22 can be classified as follows:

- Based on operating temperature
- Based on operating current.

In section 14 - Standard features it is possible to identify the type of protection for each W22 line.

### 11.1 Protection based on operating temperature

Continuous duty motors must be protected from overload either by a device integrated into the motor or via an independent protection system, usually a thermal relay with rated or setting current, equal to or below the value obtained when multiplying the power supply rated current ( $I_n$ ), as per table 17.

Service Factor	Relay setting current
1.0 up to 1.15	$I_n \times F.S.$
$\geq 1.15$	$(I_n \times F.S.) - 5\%$

Table 17 – Relay setting current referred to service factor

#### PT-100

Figure 30 - PT-100

These are temperature detectors with operating principle based on the properties that some materials vary the electric resistance with the variation in temperature (usually platinum, nickel or copper). They are also fitted with calibrated resistances that vary linearly with temperature, allowing continuous reading of motor operating temperature through a monitoring display, with high precision rate and response sensitivity.

The same detector can serve as alarm (with operation above the regular operating temperature) and trip (usually set up for the maximum temperature of the insulation class).

#### Thermistor (PTC)

Figure 31 – Thermistor (PTC)

These are thermal protectors consisting of semiconductor detectors with sudden variation of the resistance when reaching a certain temperature.

PTC is considered a thermistor with the resistance increasing drastically to a well defined temperature figure. This sudden resistance variation blocks the PTC current, causing the output relay to operate, and the main circuit to switch-off. The thermistors are of small dimensions, do not wear and have quicker response if compared to other protectors, although they do not allow continuous monitoring of motor operating temperature.

Together with their electronic circuits, these thermistors provide full protection against overheating caused by single phase, overload, under or overvoltage or frequent reversing operations.

Where thermistor protection is required to provide both alarm and trip operation, it is necessary for each phase of the motor winding to be equipped with two sets of appropriately rated thermistors.

WEG Automation has a product called RPW which is an electronic relay intended specifically to read the PTC signal and operate its output relay. For more information go to the website [www.weg.net](http://www.weg.net).

### Bimetallic thermal protectors

These are silver-contact thermal sensors, normally closed, that operate at certain temperature rise. When their operating temperature decreases, they go back to the original position instantaneously, allowing the silver contact to close again. The bimetallic thermal protectors are series-connected with the contactor coil, and can be used either as alarm or trip.

There are also other types of thermal protectors such as PT-1000, KTY and thermocouples. Contact your local WEG office closest to you for more information.

### 11.2 Protection based on operating current

Overloads are processes that usually make the temperature increase gradually. To solve this problem, the thermal protectors described in item 11.1 are quite suitable. However, the only way to protect motors against short-circuit currents is the application of fuses. This type of protection depends directly on the current and it is highly effective in cases of locked rotor.

WEG Automation supplies fuses in versions D and NH. Go to the site [www.weg.net](http://www.weg.net) for more information.

## 12. Variable speed drive application

### 12.1 Consideration regarding rated voltage

The stator windings of W22 motors are wound with class F insulation (class H optional) and are suitable for either DOL starting or via a variable speed drive. They incorporate the WEG exclusive insulation system - WISE® (WEG Insulation System Evolution) – which ensures superior electrical insulation characteristics.

The stator winding is suitable for variable speed drive application, taking into account the limits shown in table 18.

Rated voltage				
220-240/380-415 V-50 Hz // 440-460 V-60 Hz				
Motor rated voltage	Peak voltage on motor terminals	dV/dt on motor terminals	Rise time	Time between pulses
	(phase to phase)	(phase to phase)		
Vn ≤ 460 V	≤ 1600 V	≤ 5200 V/μs		
460 V < Vn ≤ 575 V	≤ 1800 V	≤ 6500 V/μs	≥ 0.1 μs	≥ 6 μs
575 V < Vn ≤ 690 V	≤ 2200 V	≤ 7800 V/μs		

Table 18 – Limit conditions for variable frequency drive operation without application of a load reactor

#### Notes:

- 1 – For the three cases above the maximum recommended switching frequency is limited at 5 kHz.
- 2 – If one or more of the above conditions is not followed accordingly (including the switching frequency), an output filter (load reactor) must be installed on the output of the VSD.

- 3 – General purpose motors with rated voltage up to 460V may be operated by a frequency inverter respecting the limits shown in table 18.
- 4 – General purpose motors which at the time of purchase did not have any indication of operation with a frequency inverter, and with nominal voltage greater than 460 V, require special insulation to support the limits indicated in table 18. Otherwise, the limits of the first line of the table (for nominal voltage up to 460 V) must be considered or a load reactor at the output of the VSD must be installed.
- 5 – General purpose motors which at the time of purchase did not have any indication of operation with a frequency inverter and which are the dual voltage type, for example 380/660 V and 400/690 V, may only operate driven by a frequency inverter in the higher voltage with the installation of load reactor or otherwise respecting the limits of the first line of the table (for nominal voltage up to 460 V).

## 12.2 Torque restrictions on variable speed drive applications

Self-ventilated variable speed drive motors have their torque limited at low frequencies due to the reduction in ventilation. Curves and derating tables must be applied to define the torque available (figure 32 / table 19).

### Constant flux condition

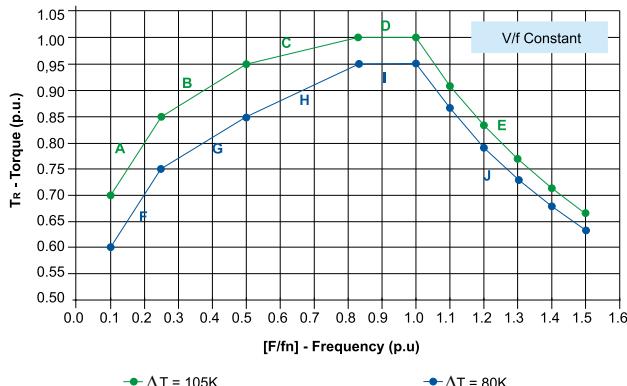

Figure 32 – Derating curve for constant flux

Derating factor with temperature rise for the insulation class*		
Interval	Limited by	Apply this equation
A	$0.10 \leq f/fn < 0.25$	$TR = (f/fn) + 0.60$
B	$0.25 \leq f/fn < 0.50$	$TR = 0.40(f/fn) + 0.75$
C	$0.50 \leq f/fn < 0.83$	$TR = 0.15(f/fn) + 0.87$
D	$0.83 \leq f/fn \leq 1.0$	$TR = 1.0$
E	$f/fn > 1.0$	$TR = 1/(f/fn)$

Derating factor to maintain temperature rise at sinusoidal source**		
Interval	Limited by	Apply this equation
F	$0.10 \leq f/fn < 0.25$	$TR = (f/fn) + 0.50$
G	$0.25 \leq f/fn < 0.50$	$TR = 0.40(f/fn) + 0.65$
H	$0.50 \leq f/fn < 0.83$	$TR = 0.30(f/fn) + 0.70$
I	$0.83 \leq f/fn \leq 1.0$	$TR = 0.95$
J	$f/fn > 1.0$	$TR = 0.95/(f/fn)$

Table 19 – Equation for torque definition at constant torque condition

(\*) When the top curve is used (green), motor temperature rise will be limited by the temperature class of the insulation material. For example, for class F insulation motors, the temperature rise will be limited at 105 K. This curve can only be used for class F insulation and class B temperature rise motors in order to ensure that, when driven by a frequency drive, the temperature rise remains class F (above 80 and below 105 K).

(\*\*) When the lower curve is used (blue), the motor temperature rise of the variable frequency drive will be the same driven by sinusoidal source. In other words, class F insulation motors with class B temperature rise will remain with class B temperature rise ( $\leq 80$  K) even when driven by a variable frequency drive.

**Note:** The derating curves given in figure 32 are related to the temperature on motor winding and thermal class. These curves do not foresee thermal tolerance factor of the motors. They are intended to show the torque limitations for variable frequency drive motors.

Exclusive

### Optimal flux condition®

The optimal flux solution was developed for low frequency applications with constant torque loads and it should not be used for variable torque loads or where the operating speed is higher than the rated frequency.

Optimal flux may only be applied under the following conditions:

- Motors must have a minimum efficiency of IE2
- Motor must be utilised with a WEG variable speed drive CFW-09 (version 2.40 or above) or CFW-11
- Application must be made with sensorless vector control (without encoder)

At optimal flux condition® the motor total losses are minimized, resulting in higher efficiency and consequently lower temperature rise. Therefore, the derating factor is smaller, as shown in figure 33 / table 20.

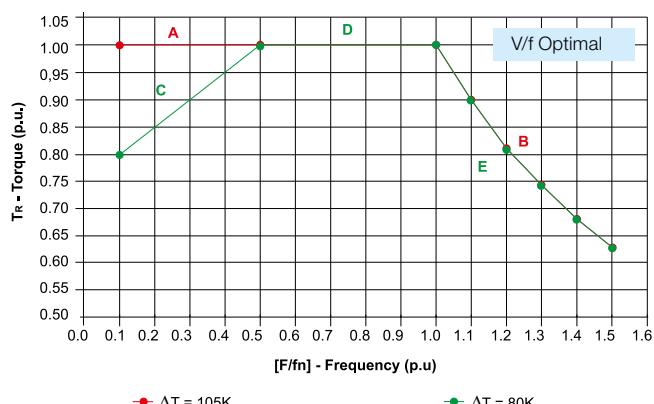

Figure 33 – Derating curve for optimal flux®

Derating factor with temperature rise for the insulation class with optimal flux®		
Interval	Limited by	Apply this equation
A	$0.10 \leq f/f_n \leq 1.0$	Constant torque
B	$f/f_n > 1.0$	$TR = 1/(f/f_n) - f_n/f$

Derating factor to maintain temperature rise at sinusoidal source with optimal flux®		
Interval	Limited by	Apply this equation
C	$0.10 \leq f/f_n < 0.50$	$TR = 0.5(f/f_n) + 0.75$
D	$0.50 \leq f/f_n \leq 1.0$	Constant Torque
E	$f/f_n > 1.0$	$TR = 1/(f/f_n) - f_n/f$

Table 20 – Equation for torque determination available at optimal flux condition

### 12.3 Restrictions regarding current flow through the bearings

Motors up to frame IEC 280S/M do not require additional features for variable frequency drive application. From frame 315S/M additional measures must be taken to avoid current flowing through the bearings. The solution for this problem is to use insulated bearings or insulated hub endshields (usually non drive endshield) and grounding brush, usually mounted on drive endshield.

WEG can supply a kit to modify motors that are not originally supplied with such protection.

### 12.4 Forced ventilation kit

For those cases where an independent cooling system is required, the W22 motors can be supplied with a forced ventilation kit, as shown in figure 34.

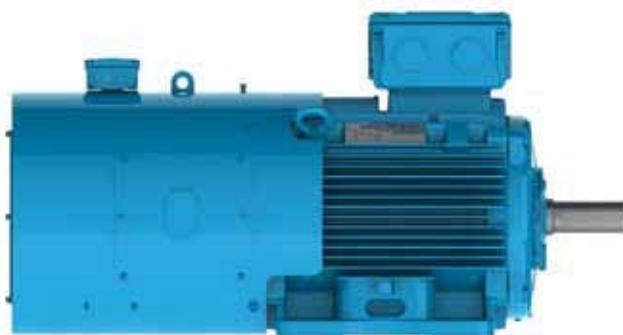

Figure 34 – Forced ventilation kit for W22 motors

When the forced ventilation kit is assembled on the motor in the factory, the overall motor length will be as shown in table 21.

As a local stock modification option, an alternative forced ventilation kit can be fitted. Please contact your local WEG office for details of these dimensions.

Frame size	Poles	Total motor length (L)	
		Without forced ventilation	With forced ventilation
90S	All	304	548
90L	All	329	573
100L	All	376	646
112M	All	393	660
132S	All	452	715
132M	All	490	753
132M/L	All	515	778
160M	All	598	855
160L	All	642	899
180M	All	664	908
180L	All	702	946
200M	All	729	976
200L	All	767	1014
225S/M	2	856	1140
	4/8	886	1170

Table 21 – Forced ventilation dimensions

### 12.5 Encoders

W22 motors may be supplied with encoders for speed control in closed loop. Encoders can be fitted to motors with either forced ventilation or with shaft mounted cooling fan (TEFC). When encoders are fitted to TEFC machines, motors may not have a second shaft end or be fitted with drip cover. The following models of encoder are available for supply:

- Kübler - Model 5020 - 1024ppr (hollow shaft)
- Hengstler - RI58 - 1024ppr (hollow shaft)
- Line & Linde - XH861 - 1024ppr (hollow shaft)
- Hubner Berlin - HOG 10 - 1024ppr (hollow shaft)
- Hubner Guinsen - FGH4 - 1024ppr (shaft)

Other models can be supplied on request.

Note: The encoders described above are of the 1024 pulses per revolution type. As an option, models of 2048 pulses per revolution are available.

## 13. Tolerances for electrical data

The following tolerances are allowed in accordance with IEC 60034-1:

Efficiency ( $\eta$ )	-0.15 (1- $\eta$ ) for $P_{nom} \leq 150$ kW / -0.1 (1- $\eta$ ) for $P_{nom} > 150$ kW Where $\eta$ is a decimal number
Power factor	$\frac{1 - \cos \phi}{6}$ Minimum 0.02 and Maximum 0.07
Slip	$\pm 20\%$ for $P_{nom} \geq 1$ kW and $\pm 30\%$ for $P_{nom} < 1$ kW
Starting current	20% (without lower limit)
Starting torque	-15% + 25%
Breakdown torque	-10%
Moment of inertia	$\pm 10\%$

Table 22 - Tolerances for electrical data

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

(2) The CEMEP reference shown means that the efficiency of motors will exceed EFF2 if tested according to IEC 60034-2.

(\*) Fitted with air deflector in the drive end side.

(\*\*) Class "F" insulation ΔT 105 K.

## W22 - Standard Efficiency

Exceeds IE1<sup>(1)</sup> - EFF2<sup>(2)</sup>

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

(2) The CEMEP reference shown means that the efficiency of motors will exceed EFF2 if tested according to IEC 60034-2.

(\*\*) Class "F" insulation ΔT 105 K.

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

(2) The CEMEP reference shown means that the efficiency of motors will exceed EFF2 if tested according to IEC 60034-2.

(\*) Fitted with air deflector in the drive end side.

(\*\*) Class "F" insulation ΔT 105 K.

# W22 - Standard Efficiency

Exceeds IE1<sup>(1)</sup> - EFF2<sup>(2)</sup>

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

(2) The CEMEP reference shown means that the efficiency of motors will exceed EFF2 if tested according to IEC 60034-2.

(\*\*) Class "F" insulation ΔT 105 K.

# W22 - Standard Efficiency

Exceeds IE1<sup>(1)</sup> - EFF2<sup>(2)</sup>

## Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

(\*\*) Class "F" insulation ΔT 105 K.

## Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

(2) The CEMEP reference shown means that the efficiency will meet EFF1 if tested according to IEC 60034-2.

(\*) Fitted with air deflector in the drive end side.

(\*\*) Class "F" insulation ΔT 105 K.

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.  
 (2) The CEMEP reference shown means that the efficiency will meet EFF1 if tested according to IEC 60034-2.

# W22 - High Efficiency

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

Notes:

(1) Efficiency values are given according to IEC 60034-2-1. They are calculated according to indirect method, with stray load losses determined by measurement.

## 19. Drip cover data

Utilization of a rain drip cover increases the total length of the motor. The additional land length can be seen an the tabel bellow.

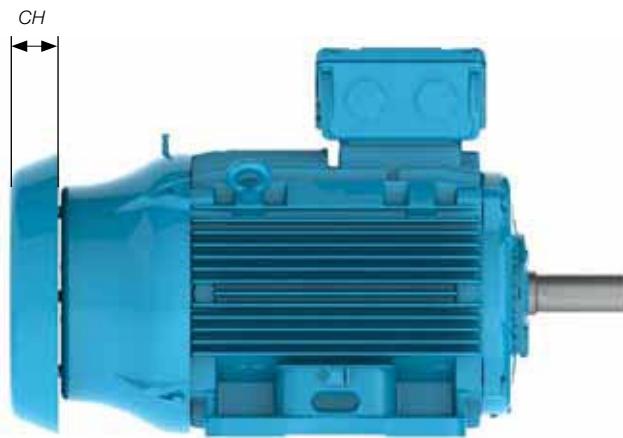

Figure 35 – Motor with drip cover

Frame	Dimension CH [increase motor length (mm)]

## 20. Packaging

W22 motors in frames 63 to 132 are packaged in cardboard boxes (see figure 36), following the dimensions, weights and volumes opposite:

Figure 36: Cardboard box

### **Top mounted terminal box**

Frame	External height (m)	External width (m)	External length (m)	Weight (kg)	Volume (m³)
63	0.26	0.21	0.30	0.2	0.02
71	0.26	0.21	0.30	0.2	0.02
80	0.27	0.26	0.36	0.7	0.02
90	0.32	0.27	0.43	0.9	0.04
100	0.33	0.27	0.46	1.4	0.04
112M	0.36	0.30	0.46	1.5	0.05
132	0.42	0.33	0.60	1.7	0.08

### **Side mounted terminal box**

Frame	External height (m)	External width (m)	External length (m)	Weight (kg)	Volume (m³)
63	19.5	23.5	28	0.2	0.01

Note: Values to be added to the net motor weight

## Notes

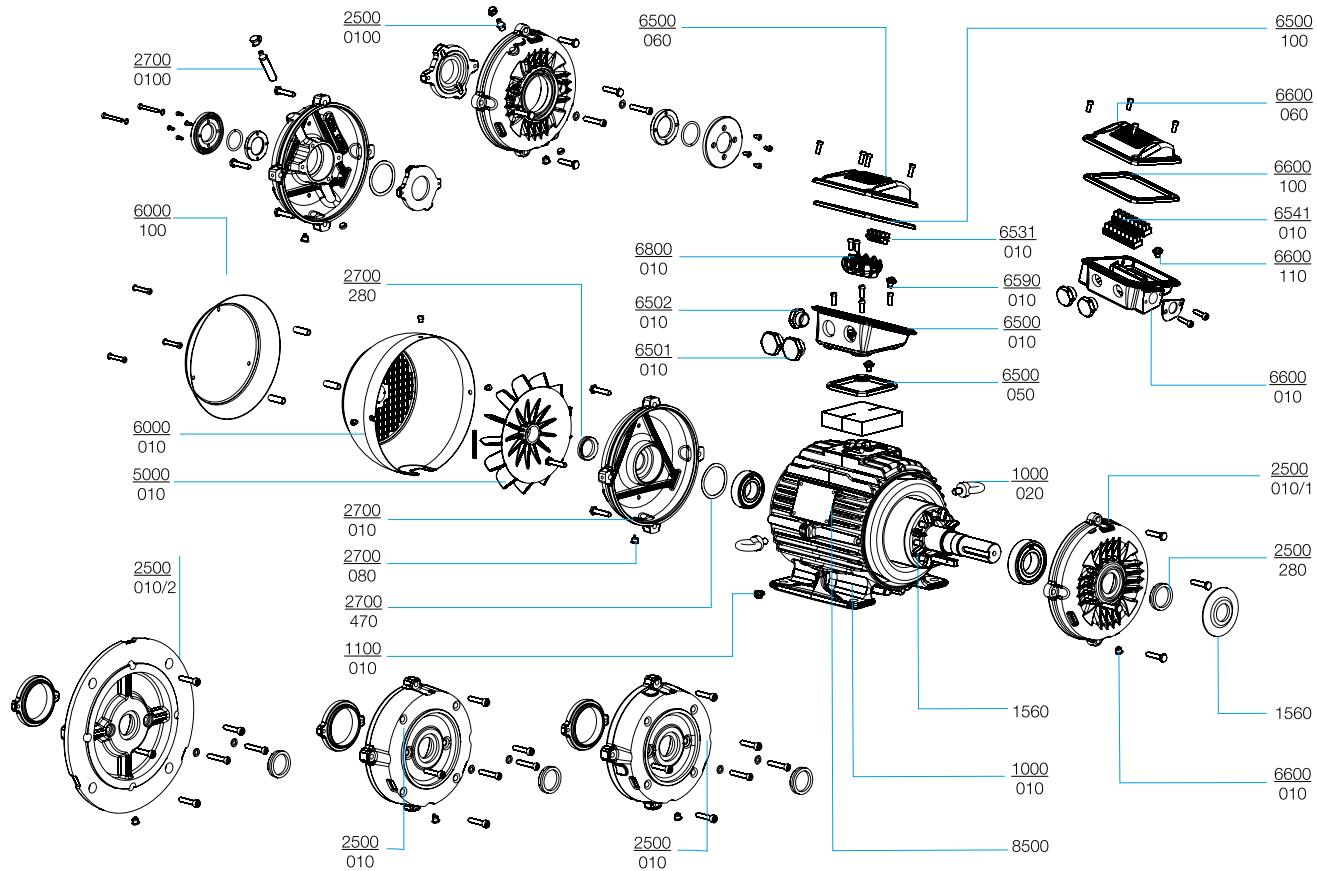

## 21. Spare parts

## General Information

The following information is required when purchasing of spare parts:

- Serial number and manufacturing date, both stamped in the nameplate
  - Spare part description
  - Codes shown are for reference only. Final codes of spare parts will depend on colour

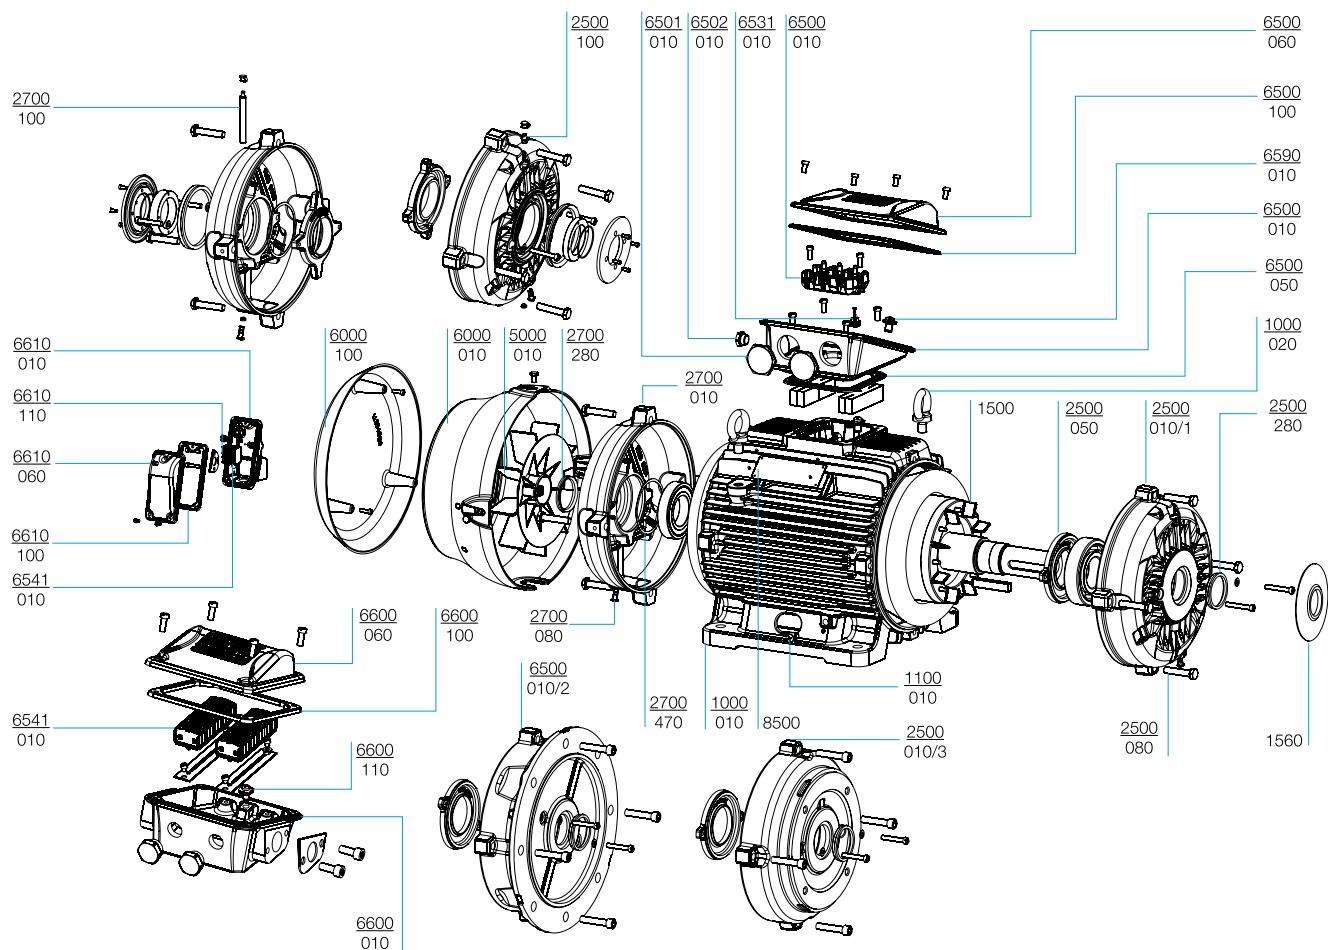

## Spare Parts Available 63-112

Motor component		Spare Part	
Item	Description	Item	Composition
2500/0010/1	Endshield, drive end	2500/1	Endshield, drain plug, shaft seal, bolts and washers
2500/0080	Drain plug, drive end		
2500/0280	Shaft seal, drive end (1)		
2500/0100	Grease nipple, drive end (2)		
2700/0010	Endshield, non-drive end	2700	Endshield, drain plug, shaft seal, bolts and washers
2700/0470	Wave washer for axial displacement		
2700/0080	Drain plug, non-drive end		
2700/0280	Shaft seal, non-drive end (1)		
2700/0100	Grease nipple, non-drive end (2)		
5000/0010	Fan	5000	Fan (3)

2500/0010/3	C Flange (5)	2500/3	C Flange
2500/0010/4	C-DIN Flange (5)	2500/3	C-DIN Flange
1560	Slinger	1560	Slinger (recommended for vertical shaft up applications, non-flange mounted)
6600/0060	Accessory terminal box lid	6600	Accessory terminal box, complete with lid, gasket, plugs, earthing terminal, bolts and washers
6600/0100	Accessory terminal box lid gasket		
6600/0010	Accessory terminal box		
6600/0110	Accessory terminal box earthing terminal		
6541/0010	Accessory connector	6541	Accessory connector, mounting rail, bolts and washers

**Notes:**

- (1) The shaft sealing may vary with product line. As a spare part, the shaft sealing in the 63-112 range will be supplied as an integral part of the endshield kit. If fitted with labyrinth seal, taconite or W3Seal, available from 90 frame upwards.
- (2) When fitted with grease nipple, the endshield spare part kit will also have grease relief, internal bearing cap and labyrinth seal (taconite or W3Seal®).
- (3) When non-plastic fan is fitted, the spare part kit is also supplied with key and circlip for fan assembly onto the shaft.
- (4) The fan cover material may vary with product line. Considering general purpose, it is steel fabricated in the 63-112 frame.
- (7) C flange dimensions according to NEMA MG1 Part 4 standard or DIN.

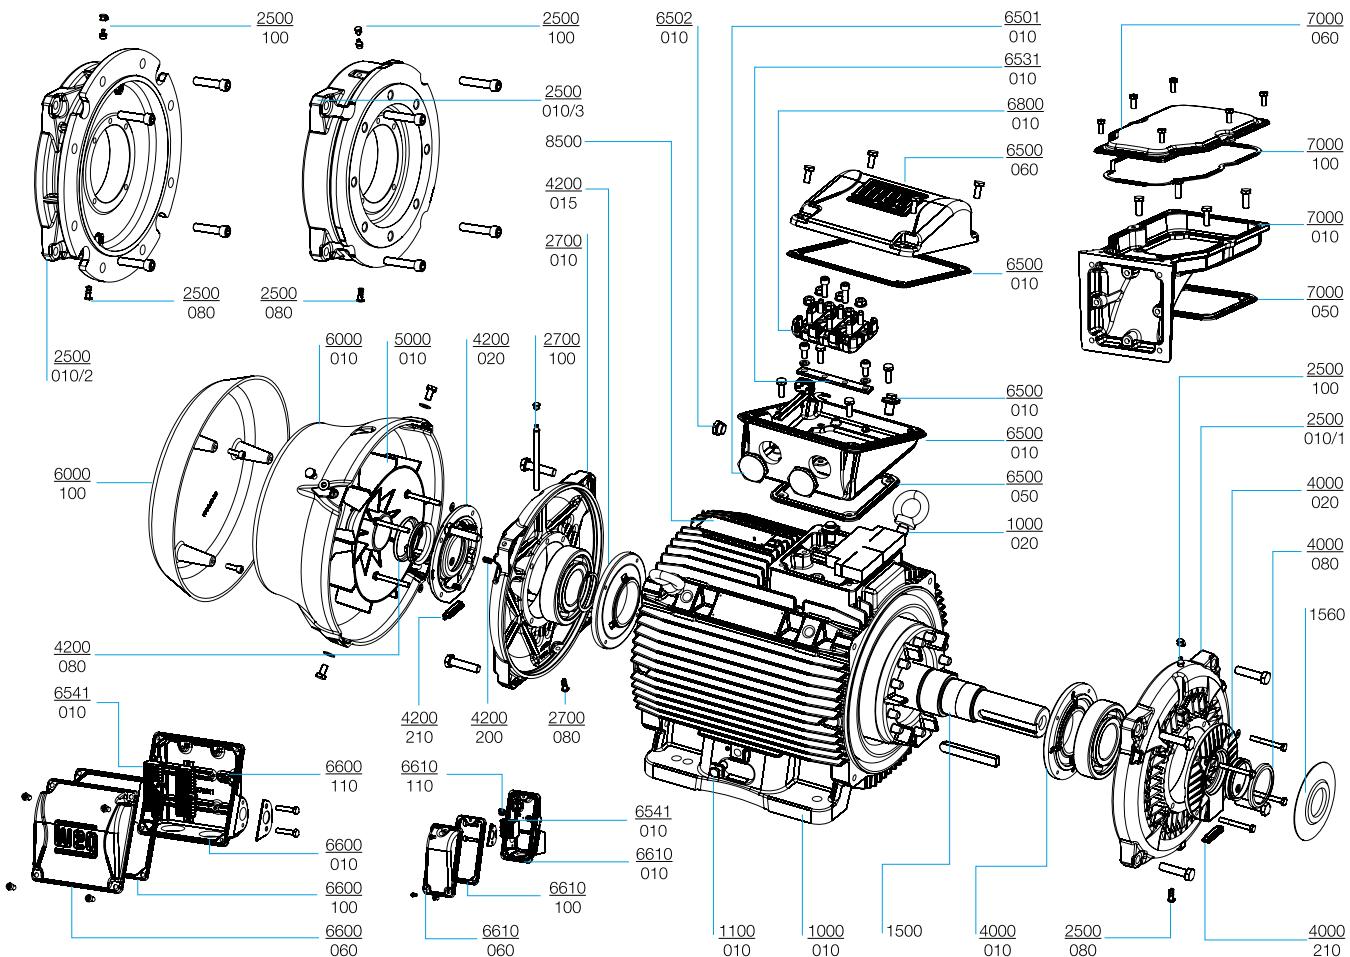

**Spare Parts Available 132-200**

8500	Main nameplate		
1500	Rotor, complete with shaft and key		
6500/0060	Terminal box lid	6500	Terminal box, complete with lid, gaskets (for lid and terminal box), plugs (for mains and accessories), earthing terminal, bolts and washers
6500/0100	Terminal box lid gasket		
6500/0010	Terminal box		
6500/0050	Terminal box gasket		
6501/0010	Terminal box plug for main leads		
6502/0010	Terminal box plug for accessory leads		
6590/0010	Terminal box earthing terminal		
6531/0010	Accessory connector	6531	Accessory connector, mounting rail, bolts and washers
6800/0010	Terminal block	6800	Terminal block, bolts and washers
2500/0010/2	FF Flange	2500/2	FF Flange
2500/0010/3	C Flange (7)	2500/3	C Flange
1560	Slinger	1560	Slinger (recommended for vertical shaft up applications, non-flange mounted)
6600/0060	Accessory terminal box lid	6600	Accessory terminal box, complete with lid, gasket, plugs, earthing terminal, bolts and washers
6600/0100	Accessory terminal box lid gasket		
6600/0010	Accessory terminal box		
6600/0110	Accessory terminal box earthing terminal		
6541/0010	Accessory connector	6541	Accessory connector, mounting rail, bolts and washers
6610/0060	Space heater accessory terminal box lid	6610	Space heater accessory terminal box, complete with lid, gasket, plugs, earthing terminal, bolts and washers
6610/0100	Space heater accessory terminal box lid gasket		
6610/0010	Space heater accessory terminal box		
6610/0110	Space heater accessory terminal box earthing terminal		
6541/0010	Accessory connector	6541	Accessory connector, mounting rail, bolts and washers

## Notes:

- (1) The shaft seal may vary with product line. As a spare part, the shaft seal in the 132-300 range will be supplied as an integral part of the endshield kit. If fitted with labyrinth seal (taconite or W3Seal) internal bearing cap is mandatory from frame 160.
- (2) When fitted with grease nipple, the endshield spare part kit will also have grease relief.
- (3) Valid when ball bearing is fitted in drive end. When the drive end is fitted with roller bearings, the wave washer is not supplied (non-drive end bearing locked with internal bearing cap).
- (4) When fitted with grease nipple in the non-drive end, the endshield spare part kit will also have grease relief and internal bearing cap.
- (5) When non-plastic fan is fitted, the spare part kit is also supplied with key and circlip for fan assembly onto the shaft.
- (6) The fan cover material may vary with product line. Considering general purpose, it is cast iron in the 160-200 range and steel fabricated to 132 frame.
- (7) C flange dimensions according to NEMA MG1 Part 4 standard in the 132-200 range and according to DIN to 132 frame.

Spare Parts Available 225 - 355

Motor component			Spare Part
Item	Description	Item	Composition
2500/0010/1	Endshield, drive end	2500/1	Endshield, grease nipple, drain plug, bolts and washers
2500/0100	Grease nipple, drive end		
2500/0080	Drain plug, drive end		
4000/0020	Bearing cap, external, drive end	4000	Bearing cap (external and internal), shaft seal, grease relief, bolts and washers
4000/0010	Bearing cap, internal, drive end		
4000/0080	Shaft seal, drive end (1)		
4000/0210	Grease relief		
2700/0010	Endshield, non-drive end	2700	Endshield, grease nipple with extensor pipe, drain plug, bolts and washers
2700/0100	Grease nipple (with extensor pipe), non-drive end		
2700/0080	Drain plug, non-drive end		
4200/0020	Bearing cap, external, non-drive end	4200	Bearing cap (external and internal), shaft seal, grease relief with extensor pipe, pre-load springs, bolts and washers
4200/0010	Bearing cap, internal, non-drive end		
4200/0200	Pre-load springs for axial displacement (2)		
4200/0080	Shaft seal, non-drive end (1)		
4200/0210	Grease relief		
5000/0010	Fan	5000	Fan (3)
6000/0010	Fan cover, cast iron	6000	Fan cover
		6050	Fan cover and drip cover
6000/0100	Drip cover	6100	Drip cover
1000/0010	Frame with wound stator		
1100/0010	Earthing terminal		
1000/0020	Lifting eyebolt	1020	Lifting eyebolt
8500	Main nameplate (4)		
1500	Rotor, complete with shaft and key		
6500/0060	Terminal box lid	6500	Terminal box, complete with lid, gaskets (for lid and terminal box), plugs (for mains and accessories), earthing terminal, bolts and washers
6500/0100	Terminal box lid gasket		
6500/0010	Terminal box		
6500/0050	Terminal box gasket		
6501/0010	Terminal box plug for main leads		
6502/0010	Terminal box plug for accessory leads		
6590/0010	Terminal box earthing terminal		
6531/0010	Accessory connector	6531	Accessory connector, mounting rail, bolts and washers
6800/0010	Terminal block	6800	Terminal block, mounting rail, bolts and washers
2500/0010/2	FF Flange	2500/2	FF Flange, grease nipple, drain plug, bolts and washers
2500/0100	Grease nipple, drive end		
2500/0080	Drain plug, drive end		
2500/0010/3	C Flange (5)	2500/3	C Flange, grease nipple, drain plug, bolts and washers
2500/0100	Grease nipple, drive end		
2500/0080	Drain plug, drive end		
1560	Slinger	1560	Slinger
6600/0060	Accessory terminal box lid	6600	Accessory terminal box, complete with lid, gasket, plugs, earthing terminal, bolts and washers
6600/0100	Accessory terminal box lid gasket		
6600/0010	Accessory terminal box		
6600/0110	Accessory terminal box earthing terminal		
6541/0010	Accessory connector	6541	Accessory connector, mounting rail, bolts and washers
6610/0060	Space heater accessory terminal box lid	6610	Space heater accessory terminal box, complete with lid, gasket, plugs, earthing terminal, bolts and washers
6610/0100	Space heater accessory terminal box lid gasket		
6610/0010	Space heater accessory terminal box		
6610/0110	Space heater accessory terminal box earthing terminal		
6541/0010	Accessory connector	6541	Accessory connector, mounting rail, bolts and washers
7000/0060	Terminal box adaptor lid	7000	Terminal box adaptor for side mounted position, complete with lid, gaskets, bolts and washers
7000/0100	Terminal box adaptor lid gasket		
7000/0010	Terminal box adaptor base		
7000/0050	Terminal box adaptor base gasket		

## Notes:

- (1) The shaft sealing may vary with product line. As a spare part, the shaft sealing in the 225-355 range will be supplied as an integral part of the bearing cap kit.
- (2) Valid when ball bearing is fitted in drive end. When the drive end is fitted with roller bearings, pre-load springs are not supplied (non-drive end bearing locked).
- (3) When non-plastic fan is fitted, the spare part kit is also supplied with key and circlip for fan assembly onto the shaft.
- (4) Main nameplate position will vary with terminal box configuration (top and side mounting)
- (5) C flange dimensions according to NEMA MG1 Part 4 standard.
